

Features

- Modbus- RTU digital control
- Add up to 127 actuators on single bus
- Multiple alarm/status messaging
- Configurable baudrate
- Able to be operated in 4-20 mA analog control

Applications

The 5618 Modbus module is available as a factory pre-installed option for Valworx 5618 series actuators EPS (Electronic Positioning System) actuators. Modbus- enabled actuators greatly simplify wiring for multiple device installations.

Valve position can be adjusted from 0–100% using an internal scale of 0–10000 (full closed to full open).

Operation

The actuator is controlled using the Modbus Write Multiple Registers command (Function Code 0x10). Available control commanded are Set Actuator Position and Actuator Stop. Actuator maintains position upon loss of signal and stays in last position upon loss of power. Available configuration commands are Set Device Address and Set Baud Rate.

Actuator status is read using the Modbus Read Multiple Registers command (Function Code 0x03). Available status includes Valve Position, Position Signal Error, Input Signal Error, Over Torque Error, Actuator Stuck Error, Actuator Opening and Actuator Closing.

The Modbus actuator can also be controlled in using a 4-20mA analog signal. Valve position is still updated in the Modbus register (0x0019) even if running in analog mode. Analog mode is canceled upon receipt of modbus position command.

Rotation	0-90°
Input Signal	4-20mA
Output Signal	4-20mA
Deadband	0.5%-5.0% Adjustable
Steps (analog)	4/20mA: Min. 150 steps/ 90°
Impedance 4-20mA	180-280 Ohms

Note: Overall accuracy of a valve assembly will vary depending on the type of valve selected and how the valve is mounted to the actuator.

Description

Modbus-enabled 5618 actuators are controlled using standard Modbus-RTU protocol. Valve position, alarms and status can all be accessed over the Modbus network with standard Modbus-RTU Function codes 0x03 and 0x10.

Upon receipt of a valve position command, the Modbus module compares the commanded position with the actual position. An electric motor/gear drive rotates the output drive until the comparisons match. Mis-matched values when the actuator is running are flagged as a position error.

Approvals

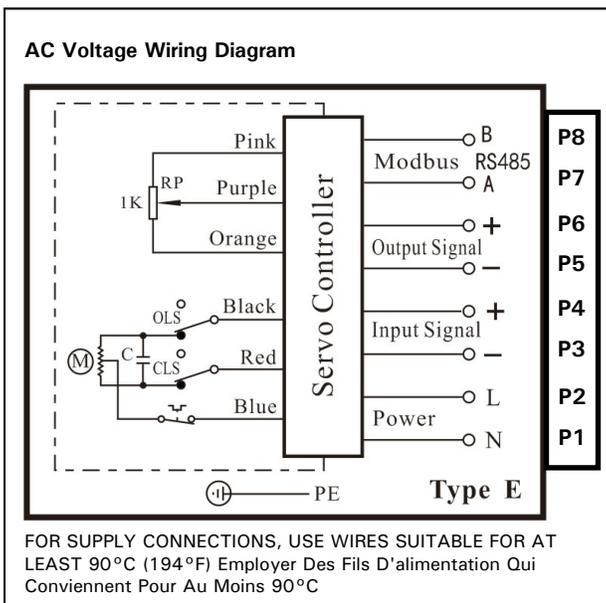

- CE Conformance

MOD - Modbus Control System

Stock Number	Description	Used with Valworx Electric Actuators
A5618MXX01	Modbus Control Module for 561857C as accessory	561857C
A5618MXX02	Modbus Control Module for 561856C as accessory	561856C
A5618MXX15	Modbus Control Module for 561876A as accessory	561876A
A5618MXX35	Modbus Control Module for 561877C as accessory	561877C

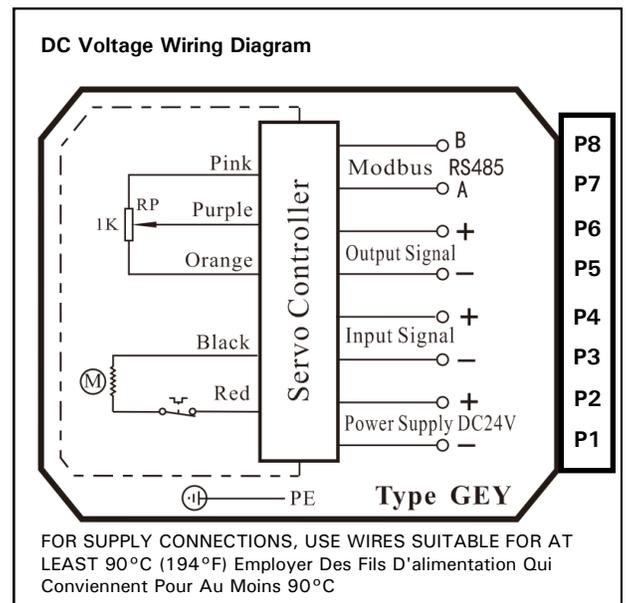

Note: The modbus is a factory installed option. The modbus is pre-installed at the factory when ordered as an option for the 5618 series electric actuator or an electric actuated valve assembly.

ELECTRICAL WIRING DIAGRAMS

AC Voltage Wiring:

1. AC power - Neutral
2. AC power - Line/Hot
3. Analog Input control signal - Negative (-)
4. Analog Input control signal - Positive (+)
5. Analog Output monitoring signal - Negative (-)
6. Analog Output monitoring signal - Positive (+)
7. RS485 A Modbus (+)
8. RS485 B Modbus (-)

DC Voltage Wiring:

1. DC power - Negative (-)
2. DC power - Positive (+)
3. Analog Input control signal - Negative (-)
4. Analog Input control signal - Positive (+)
5. Analog Output monitoring signal - Negative (-)
6. Analog Output monitoring signal - Positive (+)
7. RS485 A Modbus (+)
8. RS485 B Modbus (-)

NOTES: 1. Actuator should have its own fused and isolated circuit. 2. Do not wire actuators in parallel. 3. Output signal is 4-20mA.

Use of the output signal is optional.
